Clinical Policy: Balloon Sinus Ostial Dilation for Treatment of Chronic Sinusitis
Reference Number: WA.CP.MP.119
Last Review Date: 10/20

See Important Reminder at the end of this policy for important regulatory and legal information.

Description
Sinuplasty, also known as balloon catheter sinusotomy or balloon sinus ostial dilation, is a minimally invasive technique intended to dilate the sinus ostia in patients with chronic sinusitis. Sinuplasty systems provide a means to dilate the sinus ostia and spaces within the paranasal sinus cavities for diagnostic and therapeutic procedures to open passages and to restore normal drainage. Balloon sinuplasty is proposed to treat patients with chronic sinusitis who have exhausted less aggressive treatment options.

Policy/Criteria
I. It is the policy of Coordinated Care of Washington, Inc., in accordance with the Health Care Authority, that balloon sinuplasty for the maxillary, frontal or sphenoid sinus, singularly, is not covered.

II. It is the policy of Coordinated Care of Washington, Inc., that balloon sinuplasty for the frontal and sphenoid sinuses, combined, is medically necessary in order to relieve obstruction of the sphenoid and frontal sinus ostia, either alone or in combination with standard endoscopic sinus surgery techniques, when all of the following are met:

A. Diagnosis of one of the following (1 or 2):
   1. Chronic rhinosinusitis (CRS) has persisted for $\geq 12$ weeks and all of the following:
      a. If $> 18$ years of age, meets both of the following (i and ii):
         i. Has at least one of the following symptoms:
            a) Anterior or posterior mucopurulent nasal discharge;
            b) Nasal obstruction;
            c) Facial pain/pressure/fullness;
            d) Decreased or lost sense of smell;
         ii. Computed tomography (CT) scan shows either of the following:
            a) Polyps in nasal cavity or the middle meatus, and/or sinus opacification;
            b) Inflammation of the paranasal sinuses;
      b. If $\geq 2$ years and $\leq 18$ years of age, meets both of the following (i and ii):
         i. Has at least two of the following symptoms:
            a) Purulent rhinorrhea;
            b) Nasal obstruction;
            c) Facial pressure/pain;
            d) Cough;
         ii. Has at least one of the following findings:
            a) Endoscopic signs of mucosal edema, purulent drainage, or nasal polyposis;
            b) Mucosal changes within the ostiomeatal complex and/or sinuses, by CT scan;
2. Recurrent acute rhinosinusitis (RARS), both of the following:
   a. Documented ≥ 4 episodes of acute bacterial rhinosinusitis in the past year without
      signs or symptoms of rhinosinusitis between episodes;
   b. Anterior or posterior purulent nasal discharge and at least one of the following:
      i. Nasal obstruction;
      ii. Facial pain/pressure/fullness;

B. Continued symptoms after medical therapy consisting of both of the following (1 and 2):
   1. Antibiotic therapy meeting one of the following (a or b):
      a. Therapy guided by culture and sensitivity for ≥ 3 weeks;
      b. Beta-lactamase resistant antibiotic for ≥ 3 weeks (e.g., amoxicillin
         [recommended], amoxicillin-clavulanate, trimethoprim-sulfisoxazole,
         cefuroxime);
   2. Intranasal corticosteroids for ≥ 4 weeks, or contraindicated;

C. Allergic or immune etiologies of symptoms have been ruled out or treated appropriately.

III. It is the policy of Coordinated Care of Washington, Inc., that balloon sinuplasty is not
medically necessary in any of the following situations:
   A. For the treatment of ethmoid disease;
   B. Extensive previous sinus surgery with significant osteoneogenesis.

Background
CRS is defined as an inflammatory condition involving the paranasal sinuses and linings of the
nasal passages, which persists for 12 weeks or longer. Symptoms of CRS include anterior and/or
posterior mucopurulent drainage, nasal obstruction, facial pain, pressure, and/or fullness and
decreased sense of smell. RARS is defined as 4 or more episodes of ABRS within a year,
without persistent symptoms between episodes. The goal of medical therapy (e.g., antibiotics,
nasal irrigation, topical corticosteroids) is directed toward facilitating the drainage of sinus
secretions and treatment to eradicate the offending pathogens. Surgical intervention may be
indicated when the patient requires more than three courses of antibiotics for sinusitis within a
12-month period along with evidence of abnormalities of the sinuses or ostiomeatal complex on
nasal endoscopy or CT imaging. The goal of functional endoscopic sinus surgery is to restore
physiologic sinus ventilation and drainage, which allows for the gradual resolution of mucosal
disease. Balloon dilation is a less invasive alternative to endoscopic sinus surgery in the
management of CRS or RARS.

The goal of balloon sinuplasty is to restore normal sinus drainage by enlarging passages of the
sinus ostia and spaces within the paranasal sinus cavities, without cutting bone or removing
tissue. Per the manufacturer of the Relieva Sinus Balloon Dilation Catheter, the procedure is
performed under fluoroscopic guidance using endoscopic technique, by an otolaryngologist
trained in the use of the Balloon Sinuplasty System. Fiber optics can also be used to illuminate
the sinus cavity, without radiation exposure. The initial sinus access is achieved by the
introduction of a guide catheter into the target sinus. A flexible guidewire is then introduced
through the guide catheter and gently advanced into the target sinus. The balloon catheter tracks
smoothly over the guide wire and positioned across the blocked ostium. After the position of
the balloon catheter is confirmed, it is gradually inflated to gently restructure the blocked ostium.
The system is removed, leaving the ostium open and allowing the return of normal sinus
drainage and function with little to no disruption to the mucosal lining. Balloon sinuplasty may be performed in conjunction with endoscopic sinus surgery and used as an assistive procedure for sinus tissue biopsy or culturing, sinus lavage, drainage, or antibiotic irrigation.

Studies evaluating balloon sinuplasty are limited and include a prospective randomized trial, cohort studies, case series, observational and retrospective studies. Most studies were small and long term studies are lacking. However, the available studies suggest that balloon sinuplasty for CRS or RARS refractory to medical therapy is safe and efficacious. The data show that balloon sinuplasty can successfully dilate the sinus ostia and relieve symptoms of CRS and RARS. In addition, the use of balloon sinuplasty is supported as a treatment option by the professional societies noted below.

There is limited evidence regarding balloon sinuplasty in the pediatric population. However, two small studies have found positive effects of balloon sinuplasty in pediatric patients with CRS failing to respond to medical therapy.16,18 Additionally, one study found that balloon sinuplasty led to improved outcomes after failure to respond adequately to adenoidectomy.14

**Guideline Recommendations**

*American Academy of Otolaryngology (AAO)-Head and Neck Surgery and the American Rhinologic Society (ARS)*

Both the AAO Head and the ARS position statements on dilation of sinuses, any method (e.g., balloon, etc.), state “sinus ostial dilation (e.g., balloon ostial dilation) is a therapeutic option for selected patients with chronic rhinosinusitis (CRS) and recurrent acute rhinosinusitis (RARS) who have failed appropriate medical therapy. Clinical diagnosis of CRS and RARS should be based on symptoms of sinusitis and supported by nasal endoscopy documenting sinonasal abnormality or mucosal thickening on computed tomography of the paranasal sinuses. This approach may be used alone to dilate an obstructed sinus ostium (frontal, maxillary, or sphenoid) or in conjunction with other instruments (e.g., microdebrider, forceps). The final decision regarding use of techniques or instrumentation for sinus surgery is the responsibility of the attending surgeon. For pediatric patients, the AAO did not reach consensus on whether balloon sinuplasty should be recommended for the treatment of CRS; however, near consensus was reached regarding the safety of balloon sinuplasty.

The AAO released a 2018 Consensus Statement on Balloon Dilation of the sinuses in adult patients. They reached strong consensus that CT documentation of sinonasal disease is required before surgical management with balloon sinus ostial dilation. Furthermore, the AAO stated that balloon sinus dilation “can improve short-term quality-of-life outcomes in patients with limited CRS without polyposis.”

*American Academy of Allergy Asthma and Immunology (AAAAI), the American College of Allergy Asthma and Immunology (ACAAI), and the Joint Council of Allergy Asthma and Immunology (JCAAI)*

In 2014, the AAAI, ACAAI, and JCAAI recommended that balloon ostial dilation should be considered in a small subset of patients with medically unresponsive acute rhinosinusitis, primarily those with early or localized disease. They note that symptomatic improvement is primarily documented among patients with mild disease that could potentially be relieved with
medical therapy alone. For CRS, the AAAI, ACAAI, and JCAAI list balloon sinus dilation as one of the most commonly used modalities for patients that have failed maximal medical therapy.

Coding Implications
This clinical policy references Current Procedural Terminology (CPT®). CPT® is a registered trademark of the American Medical Association. All CPT codes and descriptions are copyrighted 2019, American Medical Association. All rights reserved. CPT codes and CPT descriptions are from the current manuals and those included herein are not intended to be all-inclusive and are included for informational purposes only. Codes referenced in this clinical policy are for informational purposes only. Inclusion or exclusion of any codes does not guarantee coverage. Providers should reference the most up-to-date sources of professional coding guidance prior to the submission of claims for reimbursement of covered services.

**Important Reminder**

This clinical policy has been developed by appropriately experienced and licensed health care professionals based on a review and consideration of currently available generally accepted standards of medical practice; peer-reviewed medical literature; government agency/program approval status; evidence-based guidelines and positions of leading national health professional organizations; views of physicians practicing in relevant clinical areas affected by this clinical policy; and other available clinical information. The Health Plan makes no representations and accepts no liability with respect to the content of any external information used or relied upon in developing this clinical policy. This clinical policy is consistent with standards of medical practice current at the time that this clinical policy was approved. “Health Plan” means a health plan that has adopted this clinical policy and that is operated or administered, in whole or in part, by Centene Management Company, LLC, or any of such health plan’s affiliates, as applicable.

The purpose of this clinical policy is to provide a guide to medical necessity, which is a component of the guidelines used to assist in making coverage decisions and administering benefits. It does not constitute a contract or guarantee regarding payment or results. Coverage decisions and the administration of benefits are subject to all terms, conditions, exclusions and limitations of the coverage documents (e.g., evidence of coverage, certificate of coverage, policy, contract of insurance, etc.), as well as to state and federal requirements and applicable Health Plan-level administrative policies and procedures.

This clinical policy is effective as of the date determined by the Health Plan. The date of posting may not be the effective date of this clinical policy. This clinical policy may be subject to applicable legal and regulatory requirements relating to provider notification. If there is a discrepancy between the effective date of this clinical policy and any applicable legal or regulatory requirement, the requirements of law and regulation shall govern. The Health Plan retains the right to change, amend or withdraw this clinical policy, and additional clinical policies may be developed and adopted as needed, at any time.

This clinical policy does not constitute medical advice, medical treatment or medical care. It is not intended to dictate to providers how to practice medicine. Providers are expected to exercise professional medical judgment in providing the most appropriate care, and are solely responsible
for the medical advice and treatment of members/enrollees. This clinical policy is not intended to recommend treatment for members/enrollees. Members/enrollees should consult with their treating physician in connection with diagnosis and treatment decisions.

Providers referred to in this clinical policy are independent contractors who exercise independent judgment and over whom the Health Plan has no control or right of control. Providers are not agents or employees of the Health Plan.

This clinical policy is the property of the Health Plan. Unauthorized copying, use, and distribution of this clinical policy or any information contained herein are strictly prohibited. Providers, members/enrollees and their representatives are bound to the terms and conditions expressed herein through the terms of their contracts. Where no such contract exists, providers, members/enrollees and their representatives agree to be bound by such terms and conditions by providing services to members/enrollees and/or submitting claims for payment for such services.

Note: For Medicaid members/enrollees, when state Medicaid coverage provisions conflict with the coverage provisions in this clinical policy, state Medicaid coverage provisions take precedence. Please refer to the state Medicaid manual for any coverage provisions pertaining to this clinical policy.
