Description
There are two categories of bariatric surgery: restrictive procedures and malabsorptive procedures. Gastric restrictive procedures include procedures where a small pouch is created in the stomach to restrict the amount of food that can be eaten, resulting in weight loss. The laparoscopic adjustable gastric banding (LAGB) and laparoscopic sleeve gastrectomy (LSG) are examples of restrictive procedures. Malabsorptive procedures bypass portions of the stomach and intestines causing incomplete digestion and absorption of food. Duodenal switch is an example of a malabsorptive procedure. Roux-en-y gastric bypass (RYGB), biliopancreatic diversion with duodenal switch (BPD-DS), and biliopancreatic diversion with gastric reduction duodenal switch (BPD-GRDS) are examples of restrictive and malabsorptive procedures.

Policy/Criteria
It is the policy of Coordinated Care of Washington, Inc., in accordance with WAC 182-531-1600, that the only covered bariatric surgery for patients age \( \geq \) 18 and < 21 years, is laparoscopic sleeve gastrectomy.

It is the policy of Coordinated Care of Washington, Inc., in accordance with the Health Care Authority’s Health Technology Assessment, that bariatric surgery is covered only if the service is provided by a facility that is accredited by the Metabolic and Bariatric Surgery Accreditation and Quality Improvement Program (MBSAQIP).

Coordinated Care may authorize up to 34 units of a bariatric case management service as part of the Stage II bariatric surgery approval. One unit of HCPCS code G9012 = 15 minutes of service. This fee is for the primary care provider or bariatric surgeon performing the services required for Bariatric Surgery Stage II. This includes overseeing weight loss and coordinating and tracking all the necessary referrals, which consist of a psychological evaluation, nutritional counseling, and required medical consultations.

It is the policy of Coordinated Care of Washington, Inc., in accordance with the Health Care Authority’s Health Technology Assessment, that bariatric surgery is medically necessary when the following criteria under section I and II are met:

1. Medical history, meets all of the following:
   A. Age \( \geq \) 18 and
   B. Obesity has continued despite previous weight loss attempts, or waiting for attempted weight loss could result in worsening of a health condition and one of the following (1, 2 or 3):
1. BMI ≥ 40 kg/m² and LABG, LSG, laparoscopic RYGB or laparoscopic BPD DS/BPD-GRDS is requested;
2. BMI ≥ 35 and < 40 kg/m² and both of the following:
   i. LAGB, LSG, laparoscopic RYGB or BPD-DS/BPD-GRDS is requested;
   ii. One of the following comorbidities is present:
      a) Type 2 diabetes mellitus (DM)  
      b) Poorly controlled hypertension  
      c) Dyslipidemia  
      d) Obstructive sleep apnea  
      e) Obesity-hypoventilation syndrome/Pickwickian syndrome  
      f) Nonalcoholic fatty liver disease or nonalcoholic steatohepatitis  
      g) Coronary artery disease  
      h) Gastroesophageal reflux disease  
      i) Asthma  
      j) Venous stasis disease  
      k) Severe urinary incontinence  
      l) Osteoarthritis (hip, knees and/or ankles)  
      m) Idiopathic intracranial hypertension
3. BMI ≥ 30 and < 35 kg/m² and both of the following:
   i. Type 2 DM;  
   ii. LAGB, LSG or laparoscopic RYGB is requested;

II. Preoperative evaluation and medical clearance requirements within 6 months of the scheduled surgery include all of the following:
   A. Cardiac evaluation includes an electrocardiogram and one of the following categories (1 or 2):
      1. LOW CARDIAC RISK candidates, with none of the risk factors listed in section 2, need cardiac clearance by a PCP or cardiologist. If additional testing is needed, it should be conducted by a cardiologist.
      2. HIGH CARDIAC RISK candidates need consultation/evaluation and cardiac clearance from a cardiologist. High risk candidates include those with any of the following:
         a. History of ischemic heart disease;  
         b. History of congestive heart failure;  
         c. History of cerebrovascular disease;  
         d. Glomerular filtration rate < 30 mL/min⁻¹;  
         e. High-grade arrhythmia;  
         f. Hemodynamically significant valvular heart disease.
         g. Glycemic control should be optimized as evidenced by one of the following  
         h. Hemodynamically significant valvular heart disease.
   B. Glycemic control should be optimized as evidenced by one of the following (not required if qualifying for surgery based on BMI ≥ 30 kg/m² and < 35 kg/m² with type 2 DM):
      1. HbA1c < 7.0%;  
      2. Fasting blood glucose level of ≤ 110 mg/dL;  
      3. 2-hour postprandial blood glucose concentration of ≤ 140 mg/dL;  
      4. HbA1c of 7 - 8% in candidates with advanced microvascular or macrovascular complications, extensive co-morbid conditions, or long-standing diabetes in which the general goal has been difficult to attain despite intensive efforts.
   C. Pulmonary Evaluation:
      1. Chest x-ray;
2. Screening for obstructive sleep apnea;
3. Pulmonary function testing and arterial blood gas analysis for candidates with intrinsic lung disease or disordered sleep patterns;
4. Polysomnography (PSG) for evaluation of obstructive sleep apnea when at least one of the following criteria for PSG:
   a. Recurrent witnessed apnea during sleep > 10 seconds in duration;
   b. Excessive or inappropriate daytime sleepiness such as falling asleep while driving or eating;
   c. Sleepiness that interferes with daily activities not explained by other conditions, such as poor sleep hygiene, medication, drugs, alcohol, psychiatric or psychological disorders;
   d. Having an Epworth Sleepiness Scale score > 10;
   e. Persistent or frequent disruptive snoring, choking or gasping episodes associated with awakenings;
5. Specialist should be consulted for interpretation of any abnormal findings.

D. Nutritional evaluation, including micronutrient measurements and treatment of insufficiencies/deficiencies prior to surgery.
E. Nutritional therapy/counseling
   1. Initial comprehensive diet history to include assessment of current pattern of nutrition and exercise and steps to modify problem eating behaviors;
   2. Monthly nutritional counseling until the date of the surgery;
   3. Prescribed exercise program;
   4. Must provide documentation that counseling has been conducted regarding the potential for success of weight loss surgery dependent on post-op diet modification.
F. Psychiatry/psychology consultation including all of the following:
   1. An in-person psychological evaluation to assess for major mental health disorders which would contradict surgery and determine ability to comply with post-operative care and guidelines;
   2. If history is positive for alcohol or drug abuse, meets both of the following:
      a. Must provide documentation of alcohol and drug abstinence for ≥ 1 year prior to surgery;
      b. Negative urine drug screen within 3 months of request;
G. Screened with a TSH level if signs or symptoms of hypothyroidism (other than obesity) are present, and treated if found to be hypothyroid.
H. A fasting lipid panel must be obtained and treatment initiated for dyslipidemia.
I. Screening for Helicobacter pylori with a urea breath test or stool antigen test if signs or symptoms of active peptic ulcer disease are present, with documentation of treatment if positive for H. pylori.
J. Prophylactic treatment for gouty attacks in patients with a history of gout.
K. If tobacco user, must stop use > 6 weeks prior to surgery.

III. Repeat Surgeries
A. Repeat bariatric surgery is considered medically necessary for one of the following:
   1. To correct complications from a previous bariatric surgery, such as obstruction or strictures (could include conversion surgeries to LSG or RYGB or BPD-DS);
2. Conversion from LAGB to a LSG, RYGB or BPD-DS; or revision of a primary procedure that has failed due to dilation of the gastric pouch when all of the following criteria are met:
   a. All criteria listed above for the initial bariatric procedure must be met again;
   b. Previous surgery for morbid obesity was at least 2 years prior to repeat procedure;
   c. Weight loss from the initial procedure was less than 50% of the member/enrollee's excess body weight at the time of the initial procedure;
   d. If the conversion is requested due to removal of an eroded laparoscopic adjustable band, at least two months have passed between the band removal and the subsequent bariatric procedure;
   e. Documented compliance with previously prescribed postoperative nutrition and exercise program. If non-compliant with postoperative regimen, member/enrollee will be required to take part in an established multidisciplinary bariatric program to meet all of the initial surgery criteria listed above;
   f. Supporting documentation from the provider should also include a clinical explanation of the circumstances as to why the procedure failed and if initial procedure failure was related to non-compliance with diet then why the requesting provider feels member/enrollee will be compliant with diet after repeat surgery.

3. Conversion of sleeve gastrectomy to Roux-en-Y gastric bypass for the treatment of gastro-esophageal reflux disease (GERD) when anti-reflux medical therapy has been tried and failed.

IV. Contraindications for surgical weight loss procedures include:
   A. Medically correctable causes of obesity;
   B. Current or planned pregnancy within 12 to 18 months of the procedure;
   C. Severe coagulopathy.

V. It is the policy of Coordinated Care of Washington, Inc. that that the following bariatric surgery procedures are considered investigational, because the medical literature indicates that studies have been inadequate to determine their efficacy and long-term outcomes:
   A. Distal gastric bypass (very long limb gastric bypass);
   B. Loop Gastric Bypass ("Mini-Gastric Bypass");
   C. Laparoscopic re-sleeve gastrectomy (LRSG) performed after the resulting gastric pouch is primarily too large or dilates after the original LSG;
   D. Fobi pouch;
   E. Laparoscopic greater curvature plication (Gastric Imbrication);
   F. LAP-BAND when BMI is 30 to 35 with or without comorbid conditions;
   G. AspireAssist;
   H. Endoscopic Suture Revisions post bariatric surgery;
   I. Single anastomosis duodenoileal bypass (SADI);
   J. Gastric plication/ Endoluminal vertical gastroplasty;
   K. Endoscopic gastrointestinal bypass devices (EGIBD (barrier devices);
VI. It is the policy of Coordinated Care of Washington, Inc. that the following bariatric surgery procedures are considered **not medically necessary**, due to potential complications and a lack of positive outcomes:

A. Biliopancreatic diversion (BPD) procedure (also known as the Scopinaro procedure);
B. Jejunoileal bypass (jejuno-colic bypass);
C. Vertical Banded Gastroplasty (VBG);
D. Gastric balloon;
E. Gastric pacing;
F. Gastric wrapping.

**Background**

There is sufficient evidence in peer-reviewed medical literature to support the use of the above mentioned bariatric surgeries for the clinically obese individual. Persons with clinically severe obesity are at risk for increased mortality and multiple co-morbidities. These co-morbidities include hypertension, hypertrophic cardiomyopathy, hyperlipidemia, diabetes, cholelithiasis, obstructive sleep apnea, hypoventilation, degenerative arthritis and psychosocial impairments.

The majority of severely obese patients losing weight through non-operative methods alone regain all the weight lost over the next five years. Surgical treatment is the only proven method of achieving long term weight control for the morbidly obese. Eating behaviors after surgery improve dramatically due to the restricted size of the stomach allowing only small amounts of food to be taken in at a time.

The success of the bariatric surgery does rely on the motivation and dedication to the program of the patient. The patient must be able to participate in the treatment and long-term follow up required after surgery. Studies have shown that about 10% of patients may have unsatisfactory weight loss or regain much of the weight they have lost. This may occur due to frequent snacking on high-calorie foods or lack of exercise. Technical problems that may occur include a stretched pouch due to overeating following surgery. Ensuring patients are motivated to lose weight can help prevent some of these issues.

Maximum weight loss usually occurs between 18 and 24 months postoperatively. The average weight loss at five years ranges from 48 to 74% after gastric bypass and 50 to 60% following gastric banding. Several studies have follow-up from 5-15 years with these patients maintaining weight loss of 50-60% of excess weight. The Lap Band is a small bracelet-like band placed around the top of the stomach to produce a small pouch about the size of a thumb. The size of the outlet is controlled by a circular balloon inside the band that can be inflated and deflated with saline solution through an access port placed under the skin. The more inflated the balloon, the narrower the opening and slower passage of food to the rest of the stomach.

Roux-en-Y gastric bypass (RYGB) creates a small stomach pouch, bypassing most of the stomach, duodenum, and upper intestine. Weight loss occurs through restriction of food intake and by decreasing the absorption of food by re-routing food directly from the pouch into the small intestine.
Biliopancreatic diversion with duodenal switch (BPD-DS) is a complex operation that includes 1) removing a large portion of the stomach to promote smaller meal sizes, 2) re-routing of food away from much of the small intestine to prevent partial absorption of food, and 3) re-routing of bile and other digestive juices that impair digestion. The operation bypasses most of the duodenum, but leaves a small portion for food and the absorption of some vitamins and minerals. BPD-DS produces significant weight loss, but has a greater risk of long-term complications due to decreased absorption of food, vitamins, and minerals.

There are both early and later complications associated with these operations. Early complications can include bleeding, infections, leaks from suture sites and blood clots. Strictures, hernias, and malnutrition, especially when not taking prescribed vitamins and minerals, are all late complications that can occur in addition to the above mentioned stretched pouch or separated stitches. A repeat surgery is at times required to repair some of these complications.

In an updated position statement on the role of bariatric surgery in class I obesity (BMI of 30.0–34.9 kg/m\(^2\)), the American Society for Metabolic and Bariatric Surgery (ASMBBS) recommend patients with BMI 30 to 35 kg/m\(^2\) and obesity-related co-morbidities who do not achieve substantial, durable weight loss and co-morbidity improvement with reasonable nonsurgical methods, bariatric surgery should be offered as an option for suitable individuals. In this population, surgical intervention should be considered after failure of nonsurgical treatments. Particularly given the presence of high-quality data in patients with type 2 diabetes, bariatric and metabolic surgery should be strongly considered for patients with BMI 30 to 35 kg/m\(^2\) and type 2 diabetes. AGB, SG, and RYGB have been shown to be well tolerated and effective treatments for patients with BMI 30 to 35 kg/m\(^2\). Safety and efficacy of these procedures in low-BMI patients appear to be similar to results in patients with severe obesity. Currently, the best evidence for bariatric and metabolic surgery for patients with class I obesity and co-morbid conditions exists for patients in the 18 to 65 age group.\(^{33}\)

Investigational Procedures
Long-limb or Distal Gastric Bypass for Superobesity: An RCT has recently been completed by Svanevik et al., but only perioperative outcomes have been reported thus far. Svanevik et al. found that in superobese patients with BMI between 50 and 60 kg/m(2), distal gastric bypass was associated with longer operating time and more severe complications resulting in reoperation than proximal gastric bypass. There is increased risk of adverse nutritional outcomes with longer limb gastric bypass. At this time the long-limb or distal gastric bypass for superobesity is considered investigational, until more long-term studies can be done which reflect better outcomes than existing procedures.

Loop Gastric Bypass (Mini Gastric Bypass, one-anastomosis gastric bypass): The mini gastric bypass has not been universally accepted due to higher rates of alkaline bile reflux and limited long-term research. More long-term research is needed to solidify mini gastric bypass surgery’s position as a viable bariatric surgery option.

Re-Sleeve Gastrectomy for Failed Laparoscopic Sleeve Gastrectomy: Iannelli et al. (2012) noted that laparoscopic sleeve gastrectomy (LSG) was rapidly accepted as a valuable bariatric
procedure before its effectiveness on weight loss in the long-term is clearly demonstrated. The authors report a feasibility study including 13 patients undergoing a redo LSG for either progressive weight regain after initial weight loss of insufficient weight loss. AlSabah et al. describe 24 patients who underwent re-sleeve laparoscopic gastrectomy after an initial LSG. Compared to 12 patients that initially had LSG, which was converted to LRYGB, results were similar, with no significant differences in percent of excess weight loss at one year. They conclude that larger and longer follow-up studies are needed to verify results.

Fobi Pouch or Silastic® Ring: The Fobi Pouch bariatric operation for obesity is a combination of stomach reduction and gastric bypass. The Silastic ring is placed around the vertically constructed gastric pouch above the anastomosis between the pouch and the intestinal Roux limb. Possible long term nutritional deficiencies involve fat soluble vitamin deficiencies of Calcium, Iron, B12, and Folic Acid. Patients are placed on nutritional supplements for the rest of their lives, and yearly monitoring is needed. The Fobi Pouch gastric bypass takes about double the time that a vertical banded gastroplasty operation takes. There is limited research on the outcomes of the Fobi pouch versus other bariatric surgery procedures.

Gastric Imbrication: Fried et al. (2011) completed a 3-year RCT on the safety and efficacy of laparoscopic adjustable gastric banding with and without imbrication sutures. The results of the RCT have demonstrated that SAGB combined with a conservative approach to band adjustments and limited retrogastric dissection is effective and safe with and without imbrication sutures. Not using imbrication sutures results in significant benefits in operative speed with comparable clinical weight loss and intermediate term safety. Sharma et al. conducted a randomized, double blinded trial comparing LSG and laparoscopic gastric imbrication (LGI). They found no differences in weight, age, or BMI preoperatively at 6 months or 3 years between the 2 groups.

The AspireAssist System (AspireAssist) was FDA approved in 2016. It is a weight loss device comprised of an endoscopically placed percutaneous gastrostomy tube and an external device to facilitate drainage of about 30% of each meal consumed. It is meant to be used in conjunction with diet and exercise. Thompson et al. (2017) performed a 1-year RCT comparing results of 207 patients treated with AspireAssist. The treatment group (n=137) received AspireAssist and lifestyle counseling and the control group (n=70) received lifestyle counseling alone. Compared to the control group, those who received the AspireAssist and counseling lost more weight: 58.6% of participants in the AspireAssist group and 15.3% of participants in the Lifestyle Counseling group lost at least 25% of their excess body weight (P<0.001). Additionally, Noren et al. (2016) conducted a prospective observational study on 25 patients. By the end of the 2-year observation period only 15 patients were still in the study. They concluded that AspireAssist is an efficient and safe treatment for obesity. There is no research on AspireAssist versus other bariatric surgery procedures.

To enhance weight loss, the following endoscopic procedures have been attempted to promote restriction of the pouch or stoma. These revisions have included: sclerotherapy of the site using 6 to 30 mL of sodium morrhuate injected circumferentially; tissue plication systems to reduce the size of the gastrojejunostomy and the gastric pouch; revisional surgery using a tissue plication device known as StomaPhyX to reduce the pouch size; and application of the endoclip to reduce
the size of the gastrojejunal anastomosis. There is a lack of long-term outcomes for endoscopic revisions post RYGB.

The single anastomosis duodenoileal bypass (SADI), also known as single-anastomosis duodenal switch (SADS) combines restrictive, malabsorptive, and probably hormonal mechanisms for weight loss. The sleeve is created first, and the duodenum is divided after the pylorus. SADI creates an anastomosis between the side of the distal ileum and the end of the sleeve-like gastric pouch/duodenum. Data evaluating this procedure is limited. Technical complexity and long-term nutritional deficiencies have limited its acceptance.¹⁶

Endoluminal vertical gastroplasty/gastric plication is an endoscopic approach for suturing the stomach that offers the potential to perform gastric-restrictive procedures endoluminally. The anterior and posterior walls of the stomach are suctioned together, then held in place by either a stapler or T-fastener device to create a tube of stomach similar to the sleeve gastrectomy.

Endoscopic gastrointestinal bypass devices (EGIBD) are barrier devices deployed to prevent luminal contents from being absorbed in the proximal small intestine (e.g., ValenTX, EndoBarrier). Data are still lacking about the longevity of these endobarriers and their outcomes once the barrier is removed.

Not Medically Necessary Procedures
Biliopancreatic Diversion (BPD) Procedure (Scopinaro procedure): The biliopancreatic diversion (BPD) is a malabsorptive procedure that was introduced as a solution to the high rates of liver failure resulting from bowel exclusion in the jejunoileal bypass. The procedure consists of a partial gastrectomy and gastroileostomy with a long segment of Roux limb and a short common channel, resulting in fat and starch malabsorption. BPD also has a restrictive component. The BPD/DS procedure differs from the BPD in the portion of the stomach that is removed, as well as preservation of the pylorus. This allows more forward flow of the contents of the biliopancreatic limb and avoids the complications of stasis that plagued the jejunoileal bypass (JIB). It is associated with fewer complications than BPD alone. BPD/DS is a complex procedure that is only performed at a few centers in the U.S.

Jejunoileal Bypass or Jejunoileal Intestinal Bypass (JIB): The jejunoileal bypass (also called the intestinal bypass) is performed by dividing the jejunum close to the ligament of Treitz and connecting it a short distance proximal to the ileocecal valve, thereby diverting a long segment of small bowel, resulting in malabsorption. This procedure is no longer performed due to the high complication rate and frequent need for revisional surgery. Per the American Society for Metabolic & Bariatric Surgery, the JIB is no longer a recommended bariatric surgical procedure. The lessons learned from the JIB include the crucial importance of long-term follow-up and the dangers of a permanent, severe and global malabsorption.

Vertical Banded Gastroplasty (VBG): VBG has fallen out of favor as a restrictive procedure for severe obesity, due largely to the advantages of adjustable gastric banding. VBG requires division of the stomach or intestinal resection, while LAGB does not. In addition, the staples used in VBG may break down and cause weight regain, and VBG requires the use of prosthetic mesh that may increase the incidence of stomach stenosis. Thus, CMS says in their National
Coverage Determination for Bariatric Treatment for Morbid Obesity that “VBG procedures are essentially no longer performed.”

Gastric Balloon: Previous endoscopic technologies used to treat obesity endoscopically, such as the gastric balloon, had limited exposure in the U.S. and were removed from the market because of associated complications, such as balloon deflation with migration and resultant small intestinal obstruction.

Gastric Pacing: A number of procedures have been investigated for weight loss surgery but have not been totally accepted by the surgical community. Gastric pacing has been performed in several trials but has not been shown to have any long-term effect and has been abandoned.

Gastric Wrapping: A gastric wrap is minimally invasive surgery and involves folding the stomach in on itself and then the edges are stitched to turn the stomach into a narrow tube therefore restricting the amount of food that can be consumed. As this surgery is very new and not widely offered. There is a paucity of peer-reviewed scientific literature on this procedure.

**Coding Implications**

This clinical policy references Current Procedural Terminology (CPT®). CPT® is a registered trademark of the American Medical Association. All CPT codes and descriptions are copyrighted 2018, American Medical Association. All rights reserved. CPT codes and CPT descriptions are from the current manuals and those included herein are not intended to be all-inclusive and are included for informational purposes only. Codes referenced in this clinical policy are for informational purposes only. Inclusion or exclusion of any codes does not guarantee coverage. Providers should reference the most up-to-date sources of professional coding guidance prior to the submission of claims for reimbursement of covered services.

<td>09/19</td>
</tr>
<tr>
<td>Restructured criteria in section I. Medical History. Moved codes 43842 and 43847 to table of codes that do not support medical necessity. Added the following codes to the table that does not support medical necessity: 43647, 43881, 64590. In glycemic control section, changed HbA1C requirement to &lt;7% instead of 6.5-7%. Noted that glycemic control requirement doesn’t apply to those who qualify for surgery based on BMI between 30 and 35 with type 2 DM.</td>
<td>09/19</td>
<td>09/19</td>
</tr>
<tr>
<td>Restructure criteria in section I to more closely mirror corporate policy. Changes to section III. Repeat surgeries: Clarified in III.A.1. that repair of complications could include revisions to LSG or RYGB or to BPD-DS. Added to III.A.2 that LSG was an acceptable revision procedure. Added criteria to III.A.2.d. that if the conversion is requested due to removal of an eroded laparoscopic adjustable band, at least two months have passed between the band removal and the subsequent bariatric procedure. Added indication in III.A.3 for conversion of sleeve gastrectomy to Roux-en-Y gastric bypass for the treatment of gastro-esophageal reflux disease (GERD) when anti-reflux medical therapy has been tried and failed. Added reference to MBSAQIP certified facility.</td>
<td>02/20</td>
<td>03/20</td>
</tr>
<tr>
<td>Added coronary artery disease as a comorbidity under A.1.b.ii. Edits made to ICD-10 codes; M54-M54.9 now M54.00-M54.9; T81.1X+T81.9X now T81.10X+ - T81.9XX+; and T85.59 – T85.59 now T85.590+ - T85.598+. References reviewed and updated. Updated coverage statement to reflect WAC that allows only laparoscopic gastric band procedures for adults 18-21 years of age.</td>
<td>07/20</td>
<td>08/20</td>
</tr>
<tr>
<td>Specified that H. Pylori screening should be conducted using a urea breath test or stool antigen test. Added the following ICD-10 code ranges: M17.0-M17.9, M19.171-M19.179 and M19.271-M19.279. 10/1/20 ICD 10 updates: Replaced category K21.0-K21.9 with K21.00- K21.9. Removed “member” from II.C.4. and II.G. Reworded II.G with no impact on criteria. Replaced “member” with “member/ enrollee” in all other instances. Add guidance around case management. Updated references.</td>
<td>11/20</td>
<td>12/20</td>

**Important Reminder**

This clinical policy has been developed by appropriately experienced and licensed health care professionals based on a review and consideration of currently available generally accepted standards of medical practice; peer-reviewed medical literature; government agency/program approval status; evidence-based guidelines and positions of leading national health professional organizations; views of physicians practicing in relevant clinical areas affected by this clinical policy; and other available clinical information. The Health Plan makes no representations and accepts no liability with respect to the content of any external information used or relied upon in developing this clinical policy. This clinical policy is consistent with standards of medical practice current at the time that this clinical policy was approved. “Health Plan” means a health plan that has adopted this clinical policy and that is operated or administered, in whole or in part, by Centene Management Company, LLC, or any of such health plan’s affiliates, as applicable.

The purpose of this clinical policy is to provide a guide to medical necessity, which is a component of the guidelines used to assist in making coverage decisions and administering benefits. It does not constitute a contract or guarantee regarding payment or results. Coverage decisions and the administration of benefits are subject to all terms, conditions, exclusions and limitations of the coverage documents (e.g., evidence of coverage, certificate of coverage, policy, contract of insurance, etc.), as well as to state and federal requirements and applicable Health Plan-level administrative policies and procedures.

This clinical policy is effective as of the date determined by the Health Plan. The date of posting may not be the effective date of this clinical policy. This clinical policy may be subject to applicable legal and regulatory requirements relating to provider notification. If there is a discrepancy between the effective date of this clinical policy and any applicable legal or
regulatory requirement, the requirements of law and regulation shall govern. The Health Plan retains the right to change, amend or withdraw this clinical policy, and additional clinical policies may be developed and adopted as needed, at any time.

This clinical policy does not constitute medical advice, medical treatment or medical care. It is not intended to dictate to providers how to practice medicine. Providers are expected to exercise professional medical judgment in providing the most appropriate care, and are solely responsible for the medical advice and treatment of members/enrollees. This clinical policy is not intended to recommend treatment for members/enrollees. Members/Enrollees should consult with their treating physician in connection with diagnosis and treatment decisions.

Providers referred to in this clinical policy are independent contractors who exercise independent judgment and over whom the Health Plan has no control or right of control. Providers are not agents or employees of the Health Plan.

This clinical policy is the property of the Health Plan. Unauthorized copying, use, and distribution of this clinical policy or any information contained herein are strictly prohibited. Providers, members/enrollees and their representatives are bound to the terms and conditions expressed herein through the terms of their contracts. Where no such contract exists, providers, members/enrollees and their representatives agree to be bound by such terms and conditions by providing services to members/enrollees and/or submitting claims for payment for such services.

Note: For Medicaid members/enrollees, when state Medicaid coverage provisions conflict with the coverage provisions in this clinical policy, state Medicaid coverage provisions take precedence. Please refer to the state Medicaid manual for any coverage provisions pertaining to this clinical policy.
